

Flossing

The importance of flossing

People who floss every day are taking a significant step in keeping their teeth clean and healthy.

Periodontal disease and many cavities start between the teeth where the bristles of your toothbrush simply cannot reach. That is why flossing is necessary for removing the plaque and bacteria that cause these dental diseases.

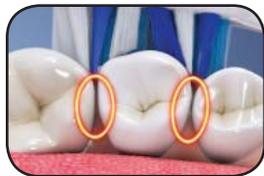

How to floss

Pull out about 18 inches of floss and wind it around the middle fingers of each hand, leaving about a 5-inch span of floss between your fingers. Pinch the floss between your thumbs and index fingers, leaving about 1 inch to work with.

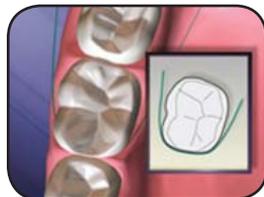

Using a gentle side-to-side motion, gently guide the floss between the teeth. Pull the floss tightly in a C-shape around the side of the tooth and slide the floss under the gumline.

Move the floss up and down several times to remove all the food and bacteria. Then pull the floss around the neighboring tooth and repeat the process.

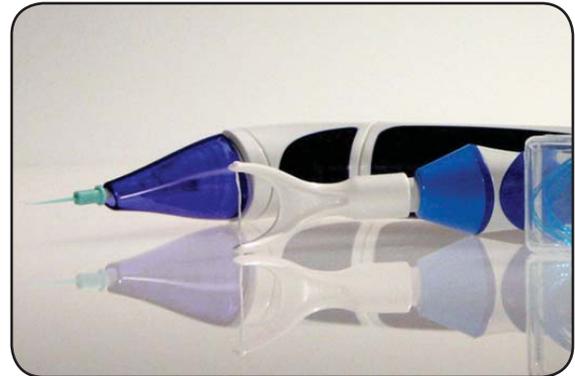

Wind the floss to a fresh section and gradually work your way around your mouth. Make sure to floss on both sides of every tooth.

Bristles do not reach between teeth

Use C-shape to floss all surfaces

How to solve flossing problems

If your gums are infected, they will bleed when you floss. That is to be expected if you are just beginning to floss. After a week or so of regular flossing, the bleeding should stop.

If you have problems reaching some areas, you may want to use a floss fork, a floss pick, or other flossing aids.

Tell us if your teeth are too tight to floss or if the floss catches or tears. This indicates that there may be problems in your mouth that need to be fixed.

Let us know if you have any questions about your flossing. We will be happy to recommend the best floss for you and offer tips for keeping your teeth and gums healthy.
